Stephen Ansolabehere served as the Principal Investigator for the overall project, Brian Schaffner and Sam Luks served as co-Principal Investigators, and Elizabeth Salazar at Harvard served as the Project Administrators. All teams contributed to the Common Content; Stephen Ansolabehere and Brian Schaffner coordinated the development of the Common Content questionnaire. Doug Rivers at YouGov provided general guidance for the sample design. Special thanks to Marissa Shih of YouGov, who served as project manager for the CCES. Thanks also to Steffen Weiss, Jason Cowden, Ruohnan Hu, Julissa Martinez, Jennifer Dechnicz, Diana Rujoiu, Mircea Dumitru, Alin Orman, Crina Voda, Alexandru Ionescu, Madalina Batu, and Mihail Mandroc for their work organizing, preparing, and processing the team surveys. Finally, thanks to Ivelisse Cuevas Molina, Shiro Kuriwaki, and Kattalina Berriochoa for their work in preparing this guide.

The Institute for Quantitative Study of the Social Sciences and the Dean of the Faculty of Arts and Sciences at Harvard provided essential research support for this project, as did each of the universities and research organizations sponsoring a team.

Referencing the Study

For research that uses the Common Content, the reference follows the ICPSR protocol:

Ansolabehere, Stephen and Brian F. Schaffner, COOPERATIVE CONGRESSIONAL ELECTION STUDY, 2016: COMMON CONTENT. [Computer File] Release 2: August 4, 2017. Cambridge, MA: Harvard University [producer] <http://cces.gov.harvard.edu>

As individual teams use their datasets for publication and make their datasets available, referencing the team content will follow the same protocol:

Part I

Introduction

The Cooperative Congressional Election Study, or CCES, seeks to study how Americans view Congress and hold their representatives accountable during elections, how they voted and their electoral experiences, and how their behavior and experiences vary with political geography and social context. This study constructed a very large sample capable of capturing variation across a wide variety of legislative constituencies. In fact, the state-level samples are sufficiently large as to measure with a reasonable degree of precision the distribution of voters' preferences within most states.

The 2016 CCES involved 60 teams, yielding a Common Content sample of 64,600 cases. The subjects for this study were recruited during the fall of 2016. Each research team purchased a 1,000 person national sample survey, conducted by YouGov of Redwood City, CA. Interviews for the 2016 survey were conducted in two waves. The pre-election wave of the questionnaire was in the field from September 28 to November 7; the post-election wave was in the field from November 9 to December 14. Each survey has approximately 120 questions. For each survey of 1,000 persons, half of the questionnaire was developed and controlled entirely by each individual research team, and half of the questionnaire is devoted to Common Content. The Common Content consists of the questions common to all team modules and has a sample size equal to the total sample size of all team modules combined. Most of the 60 teams purchased 1,000 person surveys, though a few teams purchased additional cases to increase their sample size and size of the Common Content. All cases were selected through the Internet and YouGov constructed matched random samples for this study.

Data Release 1 occurred on March 3, 2017. Data for this study is archived and available at the Harvard University Dataverse. A subsequent release will include vote validation for all respondents.

The 2016 CCES is part of an on-going study. The Cooperative Congressional Election Study formed in 2006 to study congressional elections and representation using very large scale national surveys, building off of the 2005 MIT Public Opinion Research and Training Lab (PORTL) study. The CCES has been conducted in every year since 2006 and has received support from the National Science Foundation for all even-year surveys from 2010 onward.

This guide describes the methodology behind the overall study and the measures and variables developed for the Common Content of the 2016 study. There are five parts to the 2016 CCES Common Content – sample identifiers (including state and congressional district), profile questions (largely demographic), pre-election questions, post-election questions, and contextual data (including candidate names and parties, election results, and roll call votes). This codebook provides question wordings, values, and frequencies presented of the variables for the 2016 Common Content dataset. Each Team Module has its own dataset and codebook, which will be posted to the Dataverse by July, 2018.

The criteria for inclusion of a question in the Common Content were three-fold. First, what questions would naturally be of interest to scholars researching Congress, representation, and elections? Items such as approval of Congress, approval of the individual Senator or House Member, Partisanship, Ideology, views on the economy and war, and voting behavior, as well as demographic characteristics of voters fall into this category. Second, what questions did a large number of teams want to include in the study? For example, a number of research teams expressed interests in studying roll call voting behavior of members of Congress. Another cluster of teams wanted a more extensive battery of questions on religion, which led the CCES to expand beyond the usual questions asked by the ANES. Third, what phenomena can only be measured with a large survey? The very large sample for the Common Content provides the opportunity to study legislative constituencies – states and congressional districts – as well as voters within those constituencies, to study very rare or low frequency events or very small populations, and to measure with fairly high accuracy interactions. An example of content included in the common for this reason is the battery of questions on problems encountered when voting. Such problems occur at the frequency of about 2 or 3 percent, are enough to present voting rights issues, but too small to be measured in standard surveys.

Part II

Sampling Methodology

The 2016 CCES survey was conducted over the Internet by YouGov. The Common Content was asked of 64,600 adults interviewed in October 2016 (for pre-election data), and in November 2016 (for post-election data). The sampling method uses YouGov's matched random sample methodology.

Sampling and Sample Matching

Sample matching is a methodology for selection of “representative” samples from non-randomly selected pools of respondents. It is ideally suited for Web access panels, but could also be used for other types of surveys, such as phone surveys. Sample matching starts with an enumeration of the *target population*. For general population studies, the target population is all adults, and can be enumerated through the use of the decennial Census or a high quality survey, such as the American Community Survey. In other contexts, this is known as the *sampling frame*, though, unlike conventional sampling, the sample is *not* drawn from the frame. Traditional sampling, then, selects individuals from the sampling frame at random for participation in the study. This may not be feasible or economical as the contact information, especially email addresses, is not available for all individuals in the frame and refusals to participate increase the costs of sampling in this way.

Sample selection using the matching methodology is a two-stage process. First, a random sample is drawn from the target population. We call this sample the **target sample**. Details on how the target sample is drawn are provided below, but the essential idea is that this sample is a true probability sample and thus representative of the frame from which it was drawn. However, YouGov is not able to contact these individuals directly. Therefore, the second step is that for each member of the target sample, we select one or more matching members from our pool of opt-in respondents. This is called the **matched sample**. Matching is accomplished using a large set of variables that are available in consumer and voter databases for both the target population and the opt-in panel.

The purpose of matching is to find an available respondent who is as similar as possible to the selected member of the target sample. The result is a sample of respondents who have the same measured characteristics as the target sample. Under certain conditions, described below, the matched sample will have similar properties to a true random sample. That is, the matched sample mimics the characteristics of the target sample. It is, as far as we can tell, representative of the target population (because it is similar to the target sample).

When choosing the matched sample, it is necessary to find the closest matching respondent in the panel of opt-ins to each member of the target sample. Various types of matching could be employed: exact matching, propensity score matching, and proximity matching.

Exact matching is impossible if the set of characteristics used for matching is large and, even for a small set of characteristics, requires a very large panel (to find an exact match). Propensity score matching has the disadvantage of requiring estimation of the propensity score. Either a propensity score needs to be estimated for each individual study, so the procedure is automatic, or a single propensity score must be estimated for all studies. If large numbers of variables are used the estimated propensity scores can become unstable and lead to poor samples.

YouGov employs the proximity matching method. For each variable used for matching, we define a distance function, $d(x,y)$, which describes how “close” the values x and y are on a particular attribute. The overall distance between a member of the target sample and a member of the panel is a weighted sum of the individual distance functions on each attribute. The weights can be adjusted for each study based upon which variables are thought to be important for that study, though, for the most part, we have not found the matching procedure to be sensitive to small adjustments of the weights. A large weight, on the other hand, forces the algorithm toward an exact match on that dimension.

Theoretical Background for Sample Matching

To understand better the sample matching methodology, it may be helpful to think of the target sample as a simple random sample (SRS) from the target population. The SRS yields unbiased estimates because the selection mechanism is unrelated to particular characteristics of the population. The efficiency of the SRS can be improved by using stratified sampling in place of simple random sampling. SRS is generally less efficient than stratified sampling because the size of population subgroups varies in the target sample.

Stratified random sampling partitions the population into a set of categories that are believed to be more homogeneous than the overall population, called strata. For example, we might divide the population into race, age, and gender categories. The cross-classification of these three attributes divides the overall population into a set of mutually exclusive and exhaustive groups or strata. Then an SRS is drawn from each category and the combined set of respondents constitutes a stratified sample. If the number of respondents selected in each strata is proportional to their frequency in the target population, then the sample is self-representing and requires no additional weighting.

The intuition behind sample matching is analogous to stratified sampling: if respondents who are similar on a large number of characteristics tend to be similar on other items for which we lack data, then substituting one for the other should have little impact upon the sample. This intuition can be made rigorous under certain assumptions.

Assumption 1: Ignorability. Panel participation is assumed to be ignorable with respect to the variables measured by survey conditional upon the variables used for matching. What this means is that if we examined panel participants and non-participants who have exactly the same values of the matching variables, then on average there would be no difference between how these sets of respondents answered the survey. This does not imply that panel participants and non-participants are identical, but only that the differences are captured by

the variables used for matching. Since the set of data used for matching is quite extensive, this is, in most cases, a plausible assumption.

Assumption 2: Smoothness. The expected value of the survey items given the variables used for matching is a smooth function. Smoothness is a technical term meaning that the function is continuously differentiable with bounded first derivative. In practice, this means that that the expected value function does not have any kinks or jumps.

Assumption 3: Common Support. The variables used for matching need to have a distribution that covers the same range of values for panelists and non-panelists. More precisely, the probability distribution of the matching variables must be bounded away from zero for panelists on the range of values (known as the support) taken by the non-panelists. In practice, this excludes attempts to match on variables for which there are no possible matches within the panel. For instance, it would be impossible to match on computer usage because there are no panelists without some experience using computers.

Under Assumptions 1-3, it can be shown that if the panel is sufficiently large, then the matched sample provides consistent estimates for survey measurements. The sampling variances will depend upon how close the matches are if the number of variables used for matching is large. In this study, over 150,000 respondents to YouGov's Internet surveys were used for the pool from which to construct the matches for the final sample.

Sampling Frame and Target Sample

YouGov employed a combination of two frames. The first stage used a sampling frame of U.S. Citizens from the the 2012 American Community survey, including data on age, race, gender, education, marital status, number of children under 18, family income, employment status, citizenship, state, and metropolitan area. The frame was constructed by stratified sampling from the full 2012 ACS sample with selection within strata by weighted sampling with replacement (using the person weights on the public use file). Data on congressional districts was matched to this frame from Census tables. Data on voter registration status, turnout, and vote choice was matched from the 2012 Current Population survey and 2012 national and state exit polls.

The second stage used a sampling frame of U.S. Citizens from the 2010 American Community Survey with a similar set of variables. Data on reported 2010 voter registration and turnout from the November 2010 Current Population Survey and on reported 2008 voter registration and turnout from the November 2008 Current Population Survey was matched to this frame using a weighted Euclidean distance metric. Data on religion, church attendance, born again or evangelical status, news interest, party identification and ideology was matched from the 2007 Pew U.S. Religious Landscape Survey. The target sample was selected by stratification by age, race, gender, education, and voter registration, and by simple random sampling within strata.

Stratification and Matching

The sample drawn for the CCES were chosen from the YouGov Panel, along with the MyPoints, Research Now, SSI, and GMI panels using a five-way cross-classification (age x gender x race x education x state). All respondents who completed the pre-election survey were re-invited to the post-election survey. The final set of completed pre-election interviews (numbering approximately 87,389, after quality controls were applied) were then matched to the target frame, using a weighted Euclidean distances metric.

The following distance function was used for the match:

```
fmatch <- function(target, pool) {
  25 * (abs(target$age - pool$age)/20) + #4
  5 * (target$race3 != pool$race3) + #3
  8 * (abs(target$educyrs - pool$educyrs)/4) + #2.5
  10 * (I(target$educyrs == 10) != I(pool$educyrs == 10)) + #2.5
  10 * (I(target$educyrs == 12) != I(pool$educyrs == 12)) + #2.5
  2 * (I(target$educyrs < 14) * I(target$race3 != 1) != I(pool$educyrs < 14) * I(pool
  4 * (target$gender != pool$gender) +
  (mat.employ[target$employ, pool$employ]/3) +
  (2 * mat.ideo5[target$ideo5, pool$ideo5]) +
  (3 * mat.pid5b[target$pid5b, pool$pid5b]) +
  1 * (mat.bornagain[target$bornagain, pool$bornagain]) +
  2 * (I(target$ideo5 \%in\% c(1,5)) != I(pool$ideo5 \%in\% c(1,5))) +
  15 * (target$votereg != pool$votereg) +
  25 * (target$tookpost != pool$tookpost)
}
```

- Gender: respondent's gender
- Age: respondent's age in years
- Race3: categorical race variable with categories white/other, black, and Hispanic/Latino
- Educyrs: years of education
- Newsint: interest in politics
- Employ: employment status
- Bornagain: evangelical or born again status
- Pid5b: baseline party identification (from July 2012) with categories, Democrat, Independent leaning Democrat, Independent, Independent leaning Republican, Republican, and other
- Ideo5: 5-point ideology
- Tookpost: respondent took both waves of the survey

For unordered variables, matrices of distances were used, as indicated above.

Weighting

For each team and the common content, the matched cases were then weighted to the sampling frame using entropy balancing. The sample is weighted to adjust for any remaining imbalance that exists among the matched sample. Such imbalance results from the fact that the closest match for a particular individual from the target sample is not necessarily a perfect match across all demographics. The matched cases and the frame were combined and the combined cases were balanced on multiple moment conditions. The moment conditions included age, gender, education, race, voter registration, ideology, baseline party ID, born again status, political interest, plus their interactions. The resultant weights were then post-stratified by age, gender, education, race, and voter registration status, as needed. Additionally, for the common content, the weights were post-stratified across states and statewide political races. Weights larger than 15 in the common content were trimmed and the final weights normalized to equal sample size. The team data weights were trimmed at 7.

Using Weights

Note that the 2016 CCES Common Content includes weights for both the Pre Election and Post Election waves of the study. We recommend the use of “commonweight_vv_post” any time researchers use variables from the Post Election wave of the study. Otherwise, researchers should use the “commonweight_vv” variable to weight the data.

Note that the dataset also includes the weights “commonweight” and “commonweight_post”. These weights were calculated before the vote validation, and are therefore somewhat less desirable than “commonweight_vv_post” and “commonweight_vv”. Nevertheless, we include them in the dataset for scholars who wish to replicate analyses they conducted with the data posted prior to the vote validation.

Finally, “commonweight_vv_lgbt” should be used for any analyses that make use of variables “sexuality” or “trans”.

Accuracy of the CCES Sample

The large sample of the CCES provides allows us to validate the sampling by comparing the state level samples within the survey with the actual election results.

Comparison of the CCES with actual election results provides internal checks on the quality of the sample and responses. Specifically, we can aggregate (using the weights commonweights in the 2016 study) to the state level questions on vote for President (2016 CC16_410a), Governor (2016 CC16_411), U.S. Senator (2016 CC16_413c), and other statewide offices (2016 CC16_413a and CC16_413b). The overall relationship between Democratic share of the actual vote and Democratic share of the survey reported vote is shown in the Figures 1 - 5. For example, in Figure 1 we see the CCES estimate of the two-party vote for president

along with 95% confidence intervals constructed robust standard errors to account for the sampling weights. For each state, the presidential vote estimate falls along the 45-degree line, indicating that the CCES estimate of the presidential vote share is very close to the actual vote share for that state. The subsequent plots show the same relationships for other offices. In most cases, the actual two-party vote share falls within the 95% confidence intervals for the CCES estimates.

Figure 1: Presidential Vote Accuracy Plot, 2016

The difference between the Democratic percent of the two party vote for each office in the sample and the actual results measures the error. That error is due to sampling and to bias. The simple difference is the Democratic party bias, the squared error is the mean squared error, and the square root of the MSE is a measure of the standard error. The average (across states) MSE, Root MSE, and Democratic Bias for each office are shown in Table 3. The partisan bias in the sample is less than one percentage point for all offices except Secretary of State. The Mean Squared Error is approximately the same size as the theoretically derived Sampling Standard Error, indicating that there is no evidence of systematic bias or of inflation of the precision of the estimates. The overall relationship between Democratic share of the actual vote and Democratic share of the survey reported vote is shown in the Figures 1-5. .

Figure 2: Senate Vote Accuracy Plot, 2016

Figure 3: Gubernatorial Vote Accuracy Plot, 2016

Figure 4: Attorney General Vote Accuracy Plot, 2016

Figure 5: Secretary of State Vote Accuracy Plot, 2016

The square root of the Mean Squared Error is an alternative estimate of the standard error. The usual estimate assumes that the only source of error comes from random sampling. The variance of the error across surveys (in this case states) includes possible measurement error, such as that caused by question wording, and sample biases, caused by non-response or misreporting.

Table 3: Survey Accuracy in 2016 CCES Sample for Statewide Offices

Office	Avg. Error (DEM Bias)	Root MSE (St. Error)	Avg. Freq (Responses)	Expected St. Error (Avg. Sample)
President	0.25%	1.59%	786	1.78
Governor	-0.40%	4.05%	527	2.17
US Senator	-0.20%	7.38%	822	1.74
Attorney General	0.51%	4.27%	798	1.76
Secretary of State	-3.05%	7.32%	798	1.76

Part III

Common Content

A tabulation of responses for each of the variables in the dataset are provided here. Contextual variables, i.e. variables that are not survey questions and were either added as text to fill in questions or added later, are tabulated in Part IV. The only exception to this separation is the vote validation variables, which we include in this section.

All counts are unweighted, raw counts. The tables distinguish between subtypes of missing data: missing due to respondent skipping and missing due to the question not being asked to the respondent (e.g. due to branching), although some inaccurate labeling *within* the missing data category may exist. Please consult the questionnaire to see the branching structure of the questions asked.

Variables with a warning mark (⚠️) are questions that were only asked of a non-random subset of the sample. Please make a note of this when analyzing these variable.

Vote Validation

Individual records were matched to the Catalist database of registered voters in the United States. Matching was performed in June, 2017. States have updated their vote history data by May of the year following the election year. It should be noted that a record may not be matched either because the individual is not registered to vote or because of incomplete or inaccurate information that prevented a match. Matches are made only with records for which there is a high level of confidence that the respondent is being assigned to the correct record. However, even by setting a high threshold of confidence, there will still be some false-positives which should be considered when using the validation records.

Among the CCES 2016 records that were matched to the voter files (i.e., were registered), approximately 80 percent were determined to have voted in the 2016 General Election and 47 percent were determined to have voted in the 2016 Primary Elections.

There are three possible ways to measure turnout in the 2016 CCES using the validation variables. Two use only the “E2016GVM” vote validation variable while the third uses this variable in conjunction with self-reported registration (`votereg_post`) and self-reported turnout (`CC16_401`).

1. **Un-matched as non-voters.** The first specification defines *voters* as respondents with a validated voting record no matter their mode of participation, and defines *non-voters* as both matched non-voters and non-matched respondents. This specification retains the integrity of the full CCES sample, no missing values are created. The justification for this approach is the fact that the most common reason that Catalist will not have a record for an individual is because that individual is not registered to vote. Indeed, rates of self-reported non-registration and non-voting are much higher among un-matched respondents than among those for whom there is a match.
2. **Only matched non-voters as non-voters.** The second specification defines *non-voters* as only matched non-voters. This specification reduces the CCES sample and results in validated turnout estimates that are larger than those in the first specification. However, this specification increases the level of certainty in the identification of non-voters in the CCES, because there could possibly be actual voters among non-matched respondents.
3. **Matched non-voters and self-reported non-voters as non-voters.** The third specification defines *non-voters* as (1) matched non-voters, (2) non-matched respondents who reported not being registered to vote in the “`votereg_post`” question, and (3) non-matched respondents who are self-reported non-voters in the “`CC16_401`” question. This definition excludes non-matched respondents who are self-reported voters (these individuals would be coded as missing). This definition assumes that self-reported non-voters are honest about their non-participation because there is no incentive to go against the democratic norm of participation.

Part IV

Contextual Variables

Contextual variables consist of the names and parties of the candidates for U. S. House, U. S. Senate, and Governor. For all offices, Candidate 1 is the Democrat and Candidate 2 is the Republican, except when no Democrat is running. When no Democrat is running, the Republican is listed as Candidate 1. When only one candidate is running, Candidate 2 is listed as “NA”.

Cross-reference

Variable Listing, in order of appearance in dataset. Open response items included.

Table 10: List of Variables

Variable	Label Name
V101	Case ID
commonweight	Common content weights
commonweight_post	Common content weights (post survey)
lookupzip	Pre Election Survey Respondent Zip Code
inputstate	Pre Election State Name
cdid113	CD 113th/114th Congress- post
cdid115	CD 115th Congress - post
countyfips	County FIPS code
countyname	County Name
inputstate_post	Post Election State Name
cdid113_post	CD 113th/114th Congress
cdid115_post	CD 115th Congress
countyfips_post	County FIPS code- post
countyname_post	County Name- post
birthyr	Birth Year
gender	Gender
sexuality	Sexual Orientation
trans	Transgender
educ	Education
edloan	Student debtor
votereg	Voter Registration Status
regzip	Zip code where registered
votereg_f	Registered to vote
race	Race

Table 10 – continued from previous page

Variable	Label
race_other	Race, other
multrace_1	Multi-racial - White
multrace_2	Multi-racial - Black
multrace_3	Multi-racial - Hispanic
multrace_4	Multi-racial - Asian
multrace_5	Multi-racial - Native American
multrace_8	Multi-racial - Middle Eastern
multrace_97	Multi-racial - Other
multrace_98	Multi-racial - Don't know
multrace_99	Multi-racial - None of these
hispanic	Spanish, Latino or Hispanic origin or descent
Hispanic_origin_1	Hispanic_origin - No country in Particular
Hispanic_origin_2	Hispanic_origin - United States
Hispanic_origin_3	Hispanic_origin - Mexico
Hispanic_origin_4	Hispanic_origin - Puerto Rico
Hispanic_origin_5	Hispanic_origin - Cuba
Hispanic_origin_6	Hispanic_origin - Dominican Republic
Hispanic_origin_7	Hispanic_origin - South America
Hispanic_origin_8	Hispanic_origin - Central America
Hispanic_origin_9	Hispanic_origin - Caribbean
Hispanic_origin_10	Hispanic_origin - Spain
Hispanic_origin_11	Hispanic_origin - Other
Hispanic_origin_12	Hispanic_origin - I am not of Latino, Hispanic or Spanish Heritage
Hispanic_origin_t	Hispanic_origin - None
Asian_origin_1	Asian_origin - No Country in Particular
Asian_origin_2	Asian_origin - United States
Asian_origin_3	Asian_origin - China
Asian_origin_4	Asian_origin - Japan
Asian_origin_5	Asian_origin - India

Table 10 – continued from previous page

Variable	Label
Asian_origin_6	Asian_origin - Philippines
Asian_origin_7	Asian_origin - Taiwan
Asian_origin_8	Asian_origin - Korea
Asian_origin_9	Asian_origin - Vietnam
Asian_origin_10	Asian_origin - Pakistan
Asian_origin_11	Asian_origin - Hmong
Asian_origin_12	Asian_origin - Cambodia
Asian_origin_13	Asian_origin - Thailand
Asian_origin_14	Asian_origin - Other
Asian_origin_15	Asian_origin - I am not of Asian Heritage
Asian_origin_t	Asian_origin - None
employ	Employment Status
employ_t	Employment Status - open
hadjob	Had a Job
whatkindofwork	\$whatkindofworktext
jobactivities	\$jobactivitiestext
industryclass	Industry classification
phone	Phone Service
internethome	Internet Access at Home
internetwork	Internet Access at Work
marstat	Marital Status
pid7	7 point party ID
pid3	3 point Party ID
pid3.t	3 point party ID - other
ideo5	Ideology
pew_bornagain	Born Again (Pew version)
pew_religimp	Importance of Religion (Pew Version)
pew_churatd	Church attendance (Pew Version)
pew_prayer	Frequency of Prayer (Pew Version)
religpew	Pew religion

Table 10 – continued from previous page

Variable	Label

CC16_301f	Most Important Problem - Defense spending
CC16_301g	Most Important Problem - Social security
CC16_301h	Most Important Problem - Environment
CC16_301i	Most Important Problem - Jobs
CC16_301j	Most Important Problem - Crime

Table 10 – continued from previous page

Variable	Label
CC16_301k	Most Important Problem - National security
CC16_301l	Most Important Problem - Race relations
CC16_301m	Most Important Problem - Health care
CC16_301n	Most Important Problem - Gay marriage
CC16_301o	Most Important Problem - Government Corruption
CC16_302	National Economy
CC16_303	Past year - household income
CC16_304	Next year - household income
CC16_305_1	Past four years - Married
CC16_305_2	Past four years - Lost a job
CC16_305_3	Past four years - Finished school
CC16_305_4	Past four years - Retired
CC16_305_5	Past four years - Divorced
CC16_305_6	Past four years - Had a child
CC16_305_7	Past four years - Taken a new job
CC16_305_8	Past four years - Been issued a traffic ticket
CC16_305_9	Past four years - Been a victim of a crime
CC16_305_10	Past four years - Visited an emergency room
CC16_305_11	Past four years - Received a raise at work
CC16_307	Police make R feel safe
CC16_312_1	Do not get involved
CC16_312_2	Send food, medicine and other aid to countries affected
CC16_312_3	Provide arms to those opposing ISIS
CC16_312_4	Enforce a no-fly zone
CC16_312_5	Use drones and aircraft to bomb ISIS troops
CC16_312_6	Send military support staff (non-combat)
CC16_312_7	Send significant force to fight ISIS
CC16_320a	Approve of Job - Obama
CC16_320b	Approve of Job - Congress
CC16_320c	Approve of Job - Supreme Court

Table 10 – continued from previous page

Variable	Label
CC16.320d	Approve of Job - Governor
CC16.320e	Approve of Job - Legislature
CC16.321a	Party of Government Knowledge - Reps
CC16.321b	Party of Government Knowledge - Senate
CC16.321c	Party of Government Knowledge - State Senate
CC16.321d	Party of Government Knowledge - Lower Chamber
CC16.322a	Party Recall + Name Recognition - Governor
CC16.322b	Party Recall + Name Recognition - Senator 1
CC16.322c	Party Recall + Name Recognition - Senator 2
CC16.322d	Party Recall + Name Recognition - Rep
CC16.320f	Approve of Job - Rep
CC16.320g	Approve of Job - Senator 1
CC16.320h	Approve of Job - Senator 2
CC16.316	Vote 2012
CC16.326	President 2012
CC16.326_t	President 2012 - open
CC16.327	Vote primary 2016
CC16.328	Vote primary 2016 candidate
CC16.330a	Gun Control - Background checks for all sales, including at gun shows and over the Internet
CC16.330b	Gun Control - Prohibit state and local governments from publishing the names and addresses of all gun owners
CC16.330d	Gun Control - Ban assault rifles
CC16.330e	Gun Control - Make it easier for people to obtain concealed-carry permit
CC16.331_1	Immigration - Grant legal status to all illegal immigrants who have held jobs and paid taxes for at least 3 years, and not been convicted of any felony crimes
CC16.331_2	Immigration - Increase the number of border patrols on the U.S.-Mexican border

Table 10 – continued from previous page

Variable	Label
CC16.331_3	Immigration - Grant legal status to people who were brought to the US illegally as children, but who have graduate from a U.S. high school
CC16.331_4	Immigration - Fine U.S. businesses that hire illegal immigrants
CC16.331_5	Immigration - Admit no refugees from Syria
CC16.331_6	Immigration - Increase the number of visas for overseas workers to work in the U.S.
CC16.331_7	Immigration - Identify and deport illegal immigrants
CC16.331_8	Immigration - Ban Muslims from immigrating to the U.S.
CC16.331_9	Immigration - None of these
